

Introduction (2)

Lithium depletion boundary (LDB):

In a cluster: the faintest object with ≈ 0 surface ${}^7\text{Li}$ abundance

Age inferred by comparing the **observed** and **theoretically** computed **LDB luminosity**. Uncertainty on the models propagates into a final age uncertainty (Bildsten et al. 1997, Burke et al. 2004)

Introduction (3)

LDB age-luminosity
